

1 **ABSTRACT**

2 Methods and apparatuses are provided for use in local/remote session
3 computing environments. The methods and apparatuses allow users to be more
4 alert as to which graphical user interface (GUI), e.g., local or remotely based, they
5 are viewing and interacting with. When a remote GUI is displayed in full screen
6 mode, one or more identifiers are presented to identify that the GUI is part of a
7 particular local and/or remote program/session. The identifier(s) may be
8 selectively displayed depending on the user's requirements.
